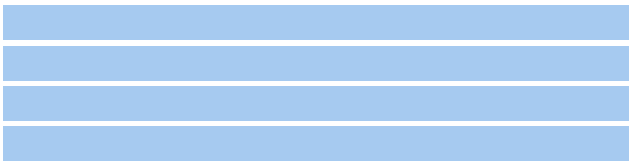
Allow User To Overwrite Auto-Populated Fields Without Affecting All Documents in the Document Set

When should I use this Javascript?
This JavaScript can be used when the eSign user needs to be able to overwrite XML auto-populated value(s) without affecting ALL documents in the document set.

What are the specifications?
The Entry Fields off the page will auto-populate with the data from the XML.
Then the data from the off the page fields will auto-populate into the Entry Fields on the page.
The user can change the auto-populated data as required by a specific document without it affecting the same mapped fields on ALL documents processed in the session due to the data carry-over feature.

What are the Design requirements?

1. Entry Fields - CSTM_A_NAME, CSTM_A_ADDR_1, CSTM_A_ADDR_2, CSTM_A_CSZ

Required Fields to be placed off the page, so the user will not see them:


1. Entry Fields - A_NAME, A_ADDRESS_LINES_1, A_ADDRESS_LINES_2, A_ADDRESS_CSZ
2. Entry Field - FIELDS_HAVE_CHANGED - Set Initial Value to "0"
